Andrés Sànchez

andres8sanchez@gmail.com • Lleida, Spain • Linkedin - Portfolio

Unity/C# engineer with 2+ years shipping mobile and console games, including four published titles for global brands such as Hot Wheels, Monster High and PJ Masks. Led the porting department that brought them to Android and other platforms, turning severe memory and framerate problems into stable releases. Builds internal tools that shorten loading times and production bottlenecks, and now applies the same engineering rigor to full-stack work (Python/Django) at IRTA.

EXPERIENCE

Petoons Studio | Barcelona, Spain **Oct 2023 - Jan 2026**

Lead Porting Engineer - Gameplay Programmer - UI Programmer

- **Delivered four Unity titles** for Android and other platforms featuring world-famous IPs such as PJ Masks, Hot Wheels and Monster High, in collaboration with partners such as BMW.
- Eliminated severe memory and framerate bottlenecks on Android and console hardware through root-cause profiling, and raised the optimization standard of the layout and 3D art teams with practical Unity guidance.
- Led the porting department, bringing console devkits, platform-specific APIs and third-party tools into production as clients required.
- Kept gameplay code maintainable and scalable with reusable C# systems and internal tools built on OOD and design patterns.

IRTA | Lleida, Spain **Jan 2026 - Present**

Full-stack developer

- Delivered a map-centered web platform that helps farmers plan irrigation from crop, weather and sensor data (Python/Django, PostgreSQL), and sped up the map by loading far less data.
- **Cut localization effort** across 6 languages with an AI-assisted translation pipeline and a verified glossary of 490 reviewed translations, replacing an estimated 140+ hours of manual work.
- Scaled one codebase to 10+ regional irrigation authorities, each with its own configuration and terminology, without maintaining separate code.

SHIPPED PROJECTS

Hot Wheels XTreme Overdrive | Unity for Android

- Kept races close and competitive with dynamic rubber-banding mechanics.
- Delivered a real-time multiplayer mode for up to four players, with stable client-server communication at a steady 30 fps on mobile hardware.
- Extended the game to BMW iX3 in-vehicle displays by solving their unique hardware constraints.

Dracamar | Unity for PC (Shipped demo for PC)

- Prevented development bottlenecks by creating prototype scenes that demonstrate Unity optimization best practices.
- Reduced loading times with an internal tool that cuts the number of asset bundles loaded at once.

Monster High Skulltimate Secrets | Unity (Shipped to all platforms)

- Delivered the skill and movement mechanics (physics and triggers), customization menus and mission interfaces with Unity UI.
- Kept memory stable and the experience seamless with world streaming that loads and unloads content by camera position.

PJ Masks Power Heroes Mighty Alliance | Unity (Shipped to all platforms)

- Fixed UI issues and performance bottlenecks across platforms, improving framerates and memory stability, and managed shipping from build validation to final release.

KO-FI Engine | C++, SDL, Assimp, ImGUI

- Co-built a video game engine from scratch in a 20-student team (C++, SDL, Assimp, ImGUI).

EDUCATION & TECHNICAL SKILLS

Universitat Politècnica de Catalunya - CITM | Barcelona, Spain
B.S. in Videogames Design & Development
Relevant Courses: Game Engines, Data Analysis, C++ Advanced Programming, Online networks applied to videogames

Unity: Unity Profiler, memory and performance optimization, asset bundles, multi-platform porting, platform integrations, uGUI, DOTween, Timeline, Shader Graph**.**
Programming & AI: C#, C++, Python, JavaScript; OOD, design patterns, data structures and algorithms; generative AI / LLM workflows
Tools: Git, Jira, Jenkins, Bitbucket, Confluence, Android Studio, Microsoft GDK, PS4/PS5 and Nintendo target managers.
Languages: English (professional), Spanish, Catalan.
Other: Composer and live musician (30+ concerts per year).
